

Week of 10/15/2018 Operations Update

Mosquito populations have been consistently low since September.

Applications this week focused on *Culex nigripalpus* again. This species will continue to replenish itself as long as there is stagnant water in ditches and the like for it breed. Zone B6 encompasses Matanzas Woods and has the highest counts of this species. All zones meeting the required treatment threshold were treated as below.

Yellow zones were treated by truck.
