

Week of 5/10/2021 Operations Update

After extensive helicopter spraying last week over three days the population of mosquitoes has been greatly reduced. The bar graph below shows the total adult mosquitoes from all traps in the District for the past year (TTM).

The graph below shows the population of the flood water mosquito species *Aedes infirmatus* increase rapidly beginning 4/30 almost two weeks after the last major rain event of 5" on 4/17- 4/18, and then precipitously drop after aerial adulticide treatments the week of 5/3.

Zones hi-lighted in yellow were sprayed by truck this week.
