

Week of 7/12/2021 Operations Update

Trap totals were the highest they have been so far this season and the highest in the past year. The bar graph below shows the total adult mosquitoes from all traps in the District for the past year (TTM).

The population of *Aedes infirmatus* was sufficiently suppressed following extensive treatments the week of 6/28/21 but returned to elevated levels in the only day of trap data (7/9/21) available after Tropical Storm Elsa had cleared the area. Mosquito populations continued to increase the week of 7/12/21 until control efforts took effect (chart below).

Zones highlighted in yellow were sprayed by truck, blocks in blue were sprayed by helicopter this week.
