

Week of 7/19/2021 Operations Update

The mosquito population was greatly reduced from the previous week following extensive spraying, but did rebound somewhat by mid-week. The bar graph below shows the total adult mosquitoes from all traps in the District for the past year (TTM).

The populations of *Aedes infirmatus* and *Culex nigripalpus* remained elevated but much reduced from the peak the previous week (chart below).

Zones highlighted in yellow were sprayed by truck this week.
